

**ROTAVEC IS WHAT YOU DO WHEN
YOU CARE FOR YOUR PARTNER,
YOUR FAMILY, YOUR ANIMALS
AND THE SUCCESS OF YOUR BUSINESS.**

Anyone who has lived through a calf scours outbreak knows the devastating toll it takes on your stress levels, family time and finances. Even when the outbreak is finally over, the negative effects on your business can be felt for years.

Scours is a real risk, not to be taken lightly. It can even happen to farmers

who are using best practice methods. And because rotavirus is prevalent across New Zealand, it can strike farms with no previous history.

With Rotavec® Corona, only one shot to pregnant dams is required to provide the protection needed to prevent infectious scours caused by rotavirus, coronavirus and *E. coli* common on New Zealand farms.

Maximise herd coverage by vaccinating the whole herd at 3 weeks prior to planned start of calving. Or individual cows can be vaccinated any time between 12 and 3 weeks before they calve.

Rotavec Corona: the flexible, one-shot way to help you avoid the hell of calf scours – and reach your full dairy potential.

Rotavec Corona. One shot. The protection you need against calf scours.
