RECEPTAL®
Synthetic Gonadotrophin Releasing Hormone

0.004 mg Buserelin per mL.

10mL & 50mL

Read the entire label before use

PRESENTATION
A ready-to-use colourless, aqueous injection solution for parenteral administration. Each ml contains 4 μg Buserelin and 10 mg benzyl alcohol, Ph.Eur., as antimicrobial preservative. Buserelin is equivalent to the natural LH/FSH releasing hormone produced in the hypothalamus. It causes simultaneous release of luteinizing hormone (LH) and follicle stimulating hormone (FSH) from the anterior pituitary.

DIRECTIONS FOR USE
For the treatment of anovulatory anoestrus in dairy cows when used in conjunction with a progesterone device and a PGF 2α analogue with luteolytic activity.
For the synchronisation of oestrus in cows and heifers when used in conjunction with a PGF 2α analogue with luteolytic activity and with or without a progesterone device as part of a 10 day fixed time insemination regime.
For the treatment of delayed ovulation in cows.
For the treatment of cystic ovaries in cows.
For the improvement of pregnancy rate in cows.
To induce ovulation of a mature follicle and thereby to synchronise ovulation more closely with mating in mares.
For the treatment of cystic ovaries and anoestrus in mares.

DOSAGE AND ADMINISTRATION
Receptal is preferably given by intramuscular injection. However, the intravenous or subcutaneous routes may also be used if desired. Syringes and needles should be from gamma irradiated packs or freshly sterilised by boiling for 20 minutes, but no alcohol or disinfectant should be used for this procedure.

Special Notes:

Cows:
For the treatment of anovulatory anoestrus in dairy cows
Receptal, used in conjunction with a progesterone device and a PGF 2α analogue with luteolytic activity.

Day 0 2.0mL Receptal
Insert progesterone device
Day 7 PGF 2α analogue at recommended luteolytic dose
Remove progesterone device
Day 8, 9 Inseminate on detection of oestrus
Day 10 2.0mL Receptal to non-detected cows and fixed time Artificial insemination immediately or within 24hrs

OR

Day 0 2.0mL Receptal
Insert progesterone device
Day 7 PGF 2α analogue at recommended luteolytic dose
Remove progesterone device
Day 9 2.0mL Receptal
Day 10 Fixed time Artificial Insemination 16-20 hours after final Receptal injection

For the synchronisation of oestrus cows and heifers
Receptal, when used as part of a 10 day fixed time oestrus synchronisation and insemination regime will increase submission rates and significantly reduce the calving to conception interval. The method comprises Receptal used in conjunction with a PGF 2α analogue with luteolytic activity with or without a progesterone implant device.

Day 0 2.0mL Receptal
Day 7 PGF 2α analogue at recommended luteolytic dose
Day 9 2.0mL Receptal
Day 10 Fixed time Artificial Insemination 16-20 hours after final Receptal injection

OR

Day 0 2.0mL Receptal
Insert progesterone device
Day 7 PGF 2α analogue at recommended luteolytic dose
Remove progesterone device
Day 9 2.0mL Receptal
Day 10 Fixed time Artificial Insemination 16-20 hours after final Receptal injection

When using fixed time insemination regimes, it is recommended that cows showing signs of oestrus after prostaglandin treatment should be inseminated when observed in oestrus rather than completing the synchronisation programme.

Follicular cysts
In the treatment of follicular cysts in cattle, it is unnecessary and contraindicated to manually express the cysts. A corpus luteum will usually be clearly detectable on either the affected or the normal ovary within about 8 days after administration of Receptal. The ‘healthy corpus luteum’ can be left to spontaneously resolve or the time to the next oestrus can be shortened by giving a PGF 2α analogue with luteolytic activity 7-9 days after the Receptal injection. Artificial insemination or service should take place during the first oestrus after treatment. Oestrus should occur within 21 days of Receptal injection, if not re-examine and retreat if a further cyst has developed.

Delayed ovulation
May be treated at the time of artificial insemination or service, or up to 6-8 hours before. Ovulation is usually induced within 24 hours of treatment.
Improvement in pregnancy rate of cows
Receptal should be injected at the time of insemination or up to 8 hours before hand. This helps to
ensure that ovulation occurs at the correct time after insemination. Improvement of pregnancy rate may
also be achieved by a single injection on day 11 or 12 after insemination by helping to prevent luteolysis
and consequent embryo mortality.

Note
The induction of ovulation is not possible in the presence of a functional corpus luteum.

Mares:
In cystic changes of the ovaries, a single treatment is usually sufficient. If 10-14 days after treatment no
response (i.e. regression of the cysts or remission of the prolonged or permanent oestrus) is seen, the
treatment should be repeated.
In anoestrous mares if no oestrus occurs within 10 days, Receptal should be administered again on the
11th and 12th day after the first treatment.
To induce ovulation of a mature follicle and thereby to synchronise ovulation more closely with mating.
Receptal should be administered on the first day on which the follicle has reached its maximum size, this
being determined by previous clinical history and rectal examinations.
Receptal is best given approximately 6 hours prior to service. This may be achieved by administering
Receptal in the morning with service in the afternoon of the same day, or alternatively with the injection
given in the early afternoon and service in the evening.
The mare should be served again the next morning if she is still in oestrus. If ovulation has not occurred
within 24 hours after treatment, then the injection should be repeated.

WITHOLDING PERIOD
Nil.

DISPOSAL
Dispose of empty container by wrapping with paper and putting in garbage.

STORAGE
Store below 25°C. Protect from light. After first opening, the product may be stored at or below 25°C for
up to 28 days.

FIRST AID
If poisoning occurs, contact a doctor or Poisons Information Centre (0800 POISON).

HANDLING PRECAUTIONS
Because of the hormonal effects of buserelin during pregnancy, women who are or could be pregnant
should not handle the product. Avoid contact with skin and eyes. Accidental spillage on the skin should
be washed off immediately with soap and water. If the preparation should by accident enter the eyes,
rinse eyes with water and if necessary contact a doctor. In case of accidental self-injection, seek medical
advice immediately and show the package insert of the label to the physician.
